Ostrich

By:
Collin C

Introduction

If you would like to know more about Ostriches and how cool they really are, read this essay and find out! More than one hundred years ago, farmers started raising Ostriches and selling them. That is probably why they are not extinct. A lot of woman used Ostrich feathers

Description

Female Ostriches are mostly gray. Male Ostriches are black with some white feathers. The male Ostrich weighs up to three hundred fifty pounds. They can also grow up to eight feet tall.

Habitat and Food

Ostriches live in Northern Africa. They are nonmigratory which means that they do not migrate.

Young

Each egg is about three pounds each and about the size of a football. The shell of an ostrich shell is very tough. You could put three hundred pounds on the egg without cracking it. A baby ostrich is about the size of a full grown chicken. Its feathers mach the ground. The male shades the egg from the sun while a female turns her eggs to keep

Conclusion

Now you know how cool and interesting Ostriches are. You know about their coloring, size, home, migration, types of food, eggs, hatching, and Parent roles. One thing I learned was that you could put a three hundred pound baby elephant on an Ostrich egg
